## September 2025 Newsletter

---

**::Commercial Rollout Begins::**  
**Bio-Pesticide Dispensers Installed at Limberlost for Strawberry Season**

---

---

We're proud to announce that the first commercial bio-pesticide dispensers for the 2025 season have been deployed at Limberlost on strawberries. This marks the beginning of full-scale commercial use following successful multi-season trials.

---

🍓 Target Crop: Strawberries

🦠 Target Pathogen: Botrytis (Grey Mold)

📍 Location: Limberlost, Western Cape

🐝 Delivery Method: Bee-vectoring via hive-mounted dispensers

---

Our bee-dispensed biological control system is now available commercially following extensive field validation across three farms. These trials consistently demonstrated:

✅ Reduced disease incidence (notably Botrytis)

✅ Improved fruit yield and quality

✅ Reduced reliance on chemical sprays

By harnessing the natural movement of honey bees, our dispenser system delivers biological agents precisely where they are needed—directly to the flowers—ensuring efficient, targeted, and sustainable crop protection.

---

---

This deployment is just the beginning of a broader rollout planned across multiple crops and regions this season. We're excited to see years of R&D now delivering real-world impact for growers.
